Toggle Modal

Modals are positioned over everything else in the document and remove scroll from the <body> so that **modal** content scrolls instead. **Modals** are unmounted when closed.

U

Uncontrolled Forms

Uncontrolled forms (or forms that are created using *uncontrolled components*) are forms in a React application where the form state is left to be controlled by the browser DOM, and the DOM is the single source of truth for the form state instead of React. React components will then use something called *refs* (*innerRef* in Reactstrap) in order to access the form state information.

Controlled forms (where React is the single source of truth for form state) is the recommended way to implement forms in React, but uncontrolled forms are sometimes more suitable.
