

Portfolio Project / Report Back

React Native Project by John Dunstan

Project Background

I plan to take my [React project](#) and revamp it into a mobile app. The app let's a user set a goal of completing X items and mark them as complete as the items are completed.

(The app definitely still is a work in progress. It especially needs improved styling on smaller viewports.)

How will your project benefit from React Native?

From a practical standpoint, my app is more intuitive and useful on a mobile device. Although checking off items at a computer is helpful, doing so when not in front of a computer is probably more typical. I also believe that connecting the physical action of tapping on a device will make the connection of completing real world items/tasks a benefit - it's nice to have a physical action (tapping) connected to completing something in real life..

Expected List of React Components

- App
 - Main
 - CountdownContainer
 - Menubar (holds number-of-items field and show-complete checkbox)
 - DisplayItems area
 - Item
 - Stats page
 - About page

Team Responsibilities

I will take on all the implementation. I'm a team of one.
